1 Step 0 — Environment & Reproducibility Setup

Sets global seeds, defines all path constants, and installs/verifies required packages. Every subsequent step imports from the objects created here — run this cell first every session.

```
[1]: # Step 0.1 Package verification
import importlib, subprocess, sys

REQUIRED = [
    "numpy", "pandas", "matplotlib", "seaborn", "scipy",
    "sklearn", "plotly", "h5py", "torch", "torchvision", "shap"
]

missing = [p for p in REQUIRED if importlib.util.find_spec(p) is None]
if missing:
    print(f"Installing missing packages: {missing}")
    subprocess.check_call([sys.executable, "-m", "pip", "install", *missing,
        ↪ "-q"])
else:
    print("All required packages are available.")

# Set non-interactive backend BEFORE importing pyplot to prevent GUI crashes on ↵
    ↪ Windows
import matplotlib
matplotlib.use('Agg')

import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
from scipy import stats
import os, pathlib, random, warnings
warnings.filterwarnings("ignore")
print("Core imports OK.")
```

All required packages are available.
Core imports OK.

```
[2]: # Minimal matplotlib smoke test (Agg backend)
import io
from IPython.display import display, Image
import matplotlib.pyplot as plt
import seaborn as sns
import numpy as np

fig, ax = plt.subplots(figsize=(4, 3))
ax.plot([1, 2, 3], [4, 5, 6])
ax.set_title("Smoke test")
buf = io.BytesIO()
fig.savefig(buf, format="png", dpi=72)
buf.seek(0)
display(Image(data=buf.read()))
plt.close(fig)
print("Matplotlib Agg smoke test: PASSED")
```

Matplotlib Agg smoke test: PASSED

```

COVERAGE SUMMARY

=====

Weather branch : 2828 train records, 638 counties, 15 states, years 2016-2022
 Satellite branch: 84 train county-years, ~3420 tiles, years [np.int64(2016),
 np.int64(2017), np.int64(2018), np.int64(2019), np.int64(2020), np.int64(2021),
 np.int64(2022)]
 Split seed: 42, method: 80/20 stratified random

2 Step 1 - USDA Soybean EDA (Target Variable)

This step fully characterises the regression target - county-level soybean yield in BU/ACRE. All analysis uses the usda_index and multimodal_index tables built in Step 0.

Sub-steps: - 1.1-1.3 Full county inventory, data quality check, FIPS resolution - 1.4 Target distribution: histogram, boxplot, normality test - 1.5 Year-over-year yield change per county - 1.6 Geographic choropleth map with Sentinel coverage overlay - 1.7 Freeze and export final label tables

```

3.795489
```

Step 1 complete.

3 Step 2 — HRRR Weather Feature Engineering

Extract agronomically-relevant weather features from WRF-HRRR GRIB2 files and align them to county centroids. Each county-year in `usda_index` receives a weather feature vector consumed by the Bi-LSTM regressor in Step 3.

Sub-steps: - 2.1 GRIB2 audit — inspect available variables per year - 2.2 Extract county-level values via nearest-grid-point lookup - 2.3 Derive engineered features (wind speed, VPD) and merge with USDA labels - 2.4 Z-score normalise all weather features (fit on train split only) - 2.5 Build `HRRRWeatherDataset` (PyTorch Dataset) and `DataLoader`

```
[13]: # Step 2.1 - HRRR GRIB2 audit
# Scan all realtime_wrf GRIB2 files, report available variables and grid
# properties.
# Identifies which agronomic variables are present in each year's file.

```

Step 2 complete.

Next: Step 3 - define and pre-train the Phase 1 Bi-LSTM weather regressor.

4 Step 3 — Ethics, Bias Audit & Fairness Specification

This step must be completed and documented before any model results are reported or used in the dissertation. It defines the fairness contract the model must satisfy.

Sub-steps: - **3.1** Data provenance & representativeness audit - **3.2** Geographic & temporal bias indicators (pre-model, computable now) - **3.3** Yield quintile distribution and label imbalance - **3.4** Fairness metric function definitions (sliced RMSE, bias per quintile, CV-error per state) - **3.5** Jensen's inequality correction constant (prior estimate; updated at Step 4.3) - **3.6** Bias registry B1–B9 with mitigations and status - **3.7** Ethical use constraints

```

```

STEP 3.3 - YIELD QUINTILE DISTRIBUTION (LABEL IMBALANCE)

Quintile break-down:

quintile	n	mean	std	min	max
Q1	716	34.51	6.81	9.3	42.5
Q2	703	46.91	2.28	42.6	50.4
Q3	705	52.88	1.35	50.5	55.1
Q4	712	57.52	1.40	55.2	60.0
Q5	699	64.16	3.40	60.1	80.4

States with ZERO Q1 (low-yield) records : None

States with ZERO Q5 (high-yield) records: ['ARIZONA', 'CALIFORNIA', 'COLORADO', 'DELAWARE', 'FLORIDA', 'GEORGIA', 'IDAHO']

Step 3.3 — Yield Quintile Distribution & Label Imbalance

Train/Test quintile proportions (should be near-equal after stratification):

	train_pct	test_pct
quintile		
Q1	20.3	20.2
Q2	19.9	19.9
Q3	19.9	19.9
Q4	20.2	20.1
Q5	19.8	19.8

Bias B3: sparse Q1 records in some states risk underestimating crop failure severity.

Recommended mitigation: oversample Q1 train records; stratify evaluation by quintile.

=====
STEP 3.5 - JENSEN'S INEQUALITY CORRECTION
=====

```

Transformation : $y_{\text{model}} = \log(\text{yield_bu_acre})$

Jensen inequality :

$E[\exp(Y)] = \exp(E[Y] + \sigma^2/2)$

Back-transform : $y_{\text{BU_ACRE}} = \exp(\hat{y} + \sigma^2/2)$

Label distribution (train split, n=2828):

mean log-yield : 3.9065

std log-yield : 0.2512

var (σ^2) : 0.063081 <- prior estimate (upper bound)

correction : $\sigma^2/2 = 0.031541$

Example (at mean log-yield):

log_pred = 3.9065

Naive exp(log_pred) = 49.72 BU/ACRE

Corrected exp(log_pred+sig^2/2) = 51.32 BU/ACRE

Absolute correction delta = 1.593 BU/ACRE

NOTE: JENSEN_SIGMA2 is the label variance here (prior).

Update it to model residual variance at Step 4.3:

JENSEN_SIGMA2 = float(np.var(y_train_pred - y_train_true))

JENSEN_SIGMA2 = 0.063081 (prior; update at Step 4.3)

=====
STEP 3.6 - BIAS REGISTRY (B1-B9)
=====

```

[B1] State-centroid weather proxy

Root Cause : All counties in a state share identical HRRR features
 Severity : High
 Mitigation : Replace with per-county TIGER centroid lat/lon
 Applied At : Step 2 (future work)
 Status : Open - documented

[B2] Corn Belt geographic dominance
 Root Cause : IL, IA, IN, MN, NE account for >60% of records
 Severity : High
 Mitigation : Inverse-frequency state loss weighting: $w_s = N/(K*N_s)$
 Applied At : Step 4.2 training loop
 Status : Mitigation planned

[B3] Low-yield observation scarcity
 Root Cause : Q1 counties have fewer multi-year records
 Severity : Medium
 Mitigation : Oversample Q1 train records; report Q1 RMSE separately
 Applied At : Step 4.3 evaluation
 Status : Mitigation planned

[B4] Log-target Jensen bias
 Root Cause : $E[\exp(y_{\text{hat}})] \neq \exp(E[y_{\text{hat}}])$; naive back-transform underestimates
 Severity : Medium
 Mitigation : Apply $\exp(y_{\text{hat}} + \sigma^2/2)$ correction at inference
 Applied At : Step 3.5 defined; Steps 4.3, 6.4, 7.4 applied
 Status : Correction defined

[B5] HRRR single-snapshot proxy
 Root Cause : Jan 1 init file is not a growing-season weather signal
 Severity : High
 Mitigation : Flag as explicit limitation; future work uses daily HRRR files
 Applied At : Step 10 (dissertation)
 Status : Acknowledged limitation

[B6] USDA reporting threshold omission
 Root Cause : Counties below minimum acreage absent from NASS data
 Severity : Medium
 Mitigation : Flag FIPS with < 3 years; exclude from policy claims
 Applied At : Steps 1.3 and 3.1
 Status : Flagged in audit

[B7] Random 80/20 temporal mixing
 Root Cause : Test set contains all years - no held-out future year
 Severity : Low-Medium
 Mitigation : Add leave-one-year-out (LOYO) evaluation for 2022 as supplement

Applied At : Step 4.3 supplement
Status : Mitigation planned

[B8] Sentinel-2 AZ 2022 tile anomaly
Root Cause : AZ 2022: 1,524 tiles vs ~60 average - likely archive artefact

Severity : Medium
Mitigation : Exclude AZ 2022 from Phase 2/3 training
Applied At : Step 6 (when unblocked)
Status : Mitigation planned

[B9] USDA surveyor bias
Root Cause : Large commercial operations over-represented in NASS survey
Severity : Medium
Mitigation : Document; model must not be used for smallholder farms
Applied At : Step 10 (dissertation)
Status : Acknowledged - cannot be corrected without external data

=====

REGISTRY SUMMARY

=====

Total biases identified	: 9
High severity	: 3
Medium severity (incl. Low-Med)	: 6
Mitigations planned / defined	: 6
Acknowledged unfixable	: 2
Open (future work only)	: 1

Step 3.6 — Bias Registry Overview

Step 3.6 complete - bias registry established.

4.1 Step 3.7 — Ethical Use Constraints

The following constraints govern any deployment or reporting of model predictions. These must be reproduced in the Ethics section of the dissertation.

Constraint	Requirement
No individual-farm inference	The model predicts county-aggregate yield only. Extrapolating to individual farm performance is statistically and ethically invalid.
Food security embargo	Predictions must not be released before the corresponding official USDA NASS report to prevent commodity market speculation.
Geographic equity disclosure	Any deployment must list which US counties are excluded (~55% of soybean counties) and acknowledge that predictions for under-represented states carry materially higher uncertainty.
Climate nonstationarity	The model trained on 2016–2022 must not be assumed valid beyond 2025 without recalibration. Yield distributions shift under progressive climate change.
LOYO supplement required	Leave-one-year-out evaluation for 2022 is required before any temporal-generalisation claims can be made.
Jensen correction mandatory	All reported metrics must use back-transformed BU/ACRE values with the Jensen correction applied. <code>JENSEN_SIGMA2</code> must be updated at Step 4.3 to the residual variance on the train split.

4.1.1 Key Tradeoffs

Tradeoff	Description
Accuracy vs Fairness	Inverse-frequency state weighting (B2) redistributes capacity from Corn Belt states to minority states. Expected: +0.5–2.0 BU/ACRE RMSE increase on IL/IA; –3–5 BU/ACRE reduction on AL/DE. Both weighted and unweighted metrics must be reported.
Model Complexity vs Interpretability	The GMU (Step 7) is the highest-accuracy architecture but least interpretable. The Ridge Regression baseline (Step 4.4) is the recommended option for any policy or advisory context.

Tradeoff	Description
Data Coverage vs Data Quality	Including all 7 years maximises training signal but injects a confounded 2019 observation. Recommendation: train on all years; evaluate 2019 and 2022 in isolation in the LOYO supplement.
Log Transform vs Direct Interpretability	USE_LOG=True benefits optimisation but complicates interpretation. Always report final metrics back-transformed to BU/ACRE with Jensen correction.
Modality Richness vs Deployability	The GMU requires both weather and satellite inputs. The Sentinel-USDA FIPS gap means Phase 2/3 is currently untrainable. The Phase 1 weather-only model is the only deployable system at this stage. This is a data infrastructure finding — not a model deficiency.

Step 3 complete. The ethics and bias audit framework is established. All fairness metric functions (`sliced_rmse`, `bias_per_group`, `cv_error_per_state`, `fairness_report`) and the Jensen correction constant (`JENSEN_SIGMA2`) are ready for use in Steps 4.3, 6.4, and 7.4.

5 Step 4 — Phase 1 Model: Bi-LSTM Weather Encoder

Train and evaluate the Phase 1 weather-only regressor using normalised HRRR features produced in Step 2. All evaluation is Jensen-corrected to BU/ACRE.

Sub-steps: - **4.1 BiLSTMRegressor**: 2-layer BiLSTM, hidden=64, 128-dim encoding, 146,049 params - **4.2 Training loop** — 80 epochs, Adam lr=1e-3, ReduceLROnPlateau, MSE on log-yield - **4.3 Evaluate**: aggregate + sliced RMSE/MAE/R² by state, year, quintile; Jensen correction applied - **4.4 Baseline comparison**: Ridge Regression vs Gradient Boosting vs Bi-LSTM - **4.5 Bias audit**: CV-Error by state; mean bias by quintile; B1/B2/B3 flags - **4.6 Save encoder weights** (`bilstm_encoder.pt`) for Step 7 GMU warm-start

```
[24]: # Step 4.1 BiLSTMRegressor
#
# Architecture:
# Input      : (batch, seq_len=1, n_features=9)
# BiLSTM     : 2 layers, hidden=64, bidirectional=True
#              + last-layer hidden (fwd + bwd) concatenated = 128-dim encoding
# Head       : Linear(128, 64) + ReLU + Linear(64, 1)
# Params     : 146,049 (verified by assertion below)
#
# encode() returns the 128-dim weather embedding consumed by Step 7 GMU.

=====
STEP 4.5 - BIAS AUDIT REPORT: Bi-LSTM PHASE 1
=====

```

CV-Error by State (threshold = 0.20; flagged = poorly served by model):

GEORGIA	0.2715	***	HIGH CV
KANSAS	0.2455	***	HIGH CV
LOUISIANA	0.2074	***	HIGH CV
DELAWARE	0.1729		
ALABAMA	0.1624		
ARKANSAS	0.1439		
ILLINOIS	0.1321		
COLORADO	0.1242		
KENTUCKY	0.1148		
IOWA	0.1055		
INDIANA	0.0895		
IDAHO	0.0663		
ARIZONA	nan		
CALIFORNIA	nan		
FLORIDA	nan		

Flagged states (CV > 0.20): ['GEORGIA', 'KANSAS', 'LOUISIANA']

Bias by Yield Quintile (B3 fairness check):

	RMSE_BU_ACRE	Bias_BU_ACRE
group		
Q1	9.000	5.893
Q2	6.224	1.219
Q3	4.991	-1.065
Q4	5.836	-4.033
Q5	10.490	-9.102

B3 REGRESSION-TO-MEAN FAIRNESS FAILURE DETECTED:

Bias(Q1) = +5.893 BU/ACRE → model OVER-predicts low-yield (crop failure) counties
 Bias(Q5) = -9.102 BU/ACRE → model UNDER-predicts bumper-yield counties
 Risk: policy models based on this output under-estimate crop failure severity.
 Mitigation: oversample Q1 train records (Step 3.3 B3 plan).

B2 Corn Belt dominance check:

Corn Belt states avg RMSE : nan BU/ACRE ([])
 Other states avg RMSE : 7.219 BU/ACRE
 B2 not detected: no systematic Corn Belt RMSE advantage.

B1 state-centroid weather proxy:

Status: Open - all counties within a state share identical HRRR features.

Detection: sp_hpa SHAP importance check deferred to Step 9.

Bias status summary:

Bias	Type	Status	Detected
B1	State-centroid proxy	Open - Step 9 SHAP	-
B2	Corn Belt dominance	Checked	No
B3	Regression-to-mean (quintile)	Checked	Yes

Step 4.5 complete - bias audit logged.

notebook_only\data\CropNet\labels\bilstm_encoder.pt
e:\learnings\University Of Hull AI\assignment-september\MSc
project\multimodal_agriculture_prediction-
notebook_only\data\CropNet\labels\bilstm_phase1_ckpt.pt
```

Context on performance:

```
RMSE = 7.386 BU/ACRE on a single January-1 HRRR snapshot per county-year.
January weather is a poor proxy for growing-season conditions (May-October).
R2 = 0.5194 reflects this fundamental data limitation (B5 bias).
Baseline models competitive with BiLSTM at seq_len=1 - expected with no
temporal signal.
Step 7 GMU, trained on growing-season daily files + Sentinel-2 imagery,
is the target architecture for publication-quality performance.
```

Next: Step 5 - Sentinel-2 Imagery EDA

6 Step 5 — Sentinel-2 Imagery EDA

Characterise the satellite modality before any model training. All imagery is loaded directly from the HDF5 files on disk — no synthetic data is generated.

Sub-steps: - **5.1** Load HDF5 tiles; visualise RGB composites and NDVI maps per state - **5.2** Per-

band statistics: mean, std, min, max across all tiles and dates - **5.3** Temporal coverage analysis — missing quarters, cloud-fraction proxy - **5.4** Data gap summary: FIPS-USDA mismatch; AZ 2022 tile anomaly (B8); recommended exclusions

```
[30]: # Step 5.1 RGB composites and NDVI maps per state
#
# For each of the 15 states × 2 years, selects the Q2 (Apr-Jun) growing-season
# HDF5 file, loads tile-0 from date-0, and renders:
# - Left panel : RGB composite (channels 0,1,2 of the AG file, uint8)
# - Right panel: pseudo-NDVI as (ch1-ch0)/(ch1+ch0+1e-6) [NIR-Red proxy]
# rendered with RdYlGn colormap
#
# All imagery is read directly from disk - no synthetic data.
# Filename pattern: Agriculture_NN_STATE_YYYY-MM-DD_YYYY-MM-DD.h5
# Q2 (Apr-Jun) start month = 04

Step 5.2 complete.

```
[32]: # Step 5.3 Temporal coverage analysis
#
# Purpose:
```

```

# 1. Build a coverage matrix: which state-year-quarter combinations are
#    present
#    on disk (1 = present, 0 = missing).
# 2. Count the number of unique dates per quarter file (some files are
#    sparse).
# 3. Cloud-fraction proxy: fraction of pixels with ALL three channels > 200
#    is used as a heuristic for cloud/snow cover (bright surfaces).
#    This is not a precision cloud mask - it flags potential quality issues.

Mean dates per quarter file: 6.0 (expected ~6 for 14-day revisit in a 90-day quarter)

Step 5.3 complete.

```
[33]: # Step 5.4 Data Gap Summary
#
# Documents all structural data gaps that affect model training:
#
# GAP 1 - FIPS-USDA mismatch (Sentinel county ANSI 001 vs USDA ANSI 003+)
#       → Phase 2 and Phase 3 are blocked
#
# GAP 2 - AZ 2022 tile anomaly (B8)
#       The AZ 2022 files contain ~381 tiles per date vs ~15 for all other
#       state-year combinations. This is consistent with an archive
#       ↪ artefact
#       (duplicate tile submissions or spatial overlap issue in the CropNet
#       download pipeline). AZ 2022 must be excluded from Phase 2/3
#       ↪ training.
#
# GAP 3 - Growing-season temporal mismatch
#       All available HRRR files are Jan-1 snapshots; Sentinel tiles cover
#       2021-2022 only. No county has both HRRR growing-season series AND
#       Sentinel imagery.
```

```

=====
STEP 5.4 - DATA GAP SUMMARY & RECOMMENDED EXCLUSIONS
=====

```

GAP 1: FIPS-USDA mismatch

```

-----
Sentinel FIPS codes (county ANSI 001) : ['01001', '04001', '05001', '06001',
'08001', '10001', '12001', '13001', '16001', '17001', '18001', '19001', '20001',
'21001', '22001']
USDA FIPS codes present                  : 649 unique FIPS
Overlap (multimodal-trainable)          : 15 FIPS = ['01001', '04001', '05001',
'06001', '08001', '10001', '12001', '13001', '16001', '17001', '18001', '19001',
'20001', '21001', '22001']

```

Root cause: Sentinel-2 tiles were downloaded for county ANSI 001 (e.g. 01001=Baldwin AL, 04001=Apache AZ ...) but the USDA NASS CSV files cover counties with ANSI code 003 in each state.

No join is possible on the current data as-is.

Impact:

Phase 1 (weather Bi-LSTM) : FULLY TRAINABLE (3,430 USDA records)
 Phase 2 (satellite encoder): BLOCKED - 0 labelled county-years
 Phase 3 (GMU fusion) : BLOCKED - depends on Phase 2

Resolution path:

Re-download USDA CSV data for county ANSI codes that match the Sentinel FIPS list above, OR re-download Sentinel tiles for the USDA county FIPS codes.

GAP 2: AZ 2022 tile count anomaly (B8)

 Tiles per state-year (all quarters combined):

state	year	total_tiles	total_dates
AZ	2022	7239	19
AR	2022	888	24
AR	2021	888	24
ID	2021	792	24
ID	2022	792	24
CO	2021	720	24
CO	2022	720	24
CA	2022	720	24
CA	2021	720	24
FL	2022	696	24
FL	2021	696	24
IL	2021	576	24
IL	2022	576	24
DE	2021	480	24
DE	2022	480	24
GA	2022	456	24
GA	2021	456	24
LA	2022	456	24
LA	2021	456	24
AL	2021	360	24
AL	2022	360	24
KY	2021	312	24
KY	2022	312	24
IA	2021	288	24
IA	2022	288	24
KS	2021	192	24
KS	2022	192	24
IN	2021	144	24
IN	2022	144	24

```

Median tiles (non-AZ state-years) : 468
AZ 2021 total tiles                : 0
AZ 2022 total tiles                : 7239  (15× median)

```

B8 CONFIRMED: AZ 2022 contains dramatically more tiles than any other state-year. This is inconsistent with Sentinel-2 tile geometry and strongly suggests a data ingestion artefact (duplicate tiles or overlapping spatial extents in the CropNet download batch).
→ AZ 2022 must be EXCLUDED from Phase 2/3 training.

GAP 3: Growing-season temporal mismatch

```

-----
USDA/HRRR years      : ['2016', '2017', '2018', '2019', '2020', '2021', '2022']
Sentinel years       : ['2021', '2022']
Year overlap         : ['2021', '2022']
HRRR files           : Jan-1 snapshot only (not growing-season time series)
Sentinel files        : Quarterly HDF5 tiles (Q1-Q4 per state)
Consequence          : Even for 2021-2022, the HRRR input is a Jan-1
                      snapshot with no growing-season weather - it cannot
                      serve as a meaningful weather co-variate for the GMU.

```

RECOMMENDED EXCLUSIONS FOR PHASE 2/3

Reason	Exclusion	Effect	Priority
	AZ 2022 (all quarters)	B8: tile anomaly - ~381	
tiles/date vs ~15 avg	Remove 1 county-year from satellite train		
set Required			
All Sentinel FIPS from Phase 2/3 training		GAP 1: no	
matching USDA labels	Phase 2/3 blocked until USDA county-001 data downloaded		
Blocking			
HRRR Jan-1 as Phase 2/3 weather co-variate	GAP 3: single Jan snapshot	growing-	
season signal GMU weather input unreliable; use growing-season daily HRRR	Future		
work			

=====

STEP 5 COMPLETE - Sentinel-2 Imagery EDA

=====

- Key findings:
- Sentinel-2 AG/NDVI: 2 years × 15 states × 4 quarters = 120 quarter-files
 - Tile shape: (n_tiles, 224, 224, 3) uint8 | n_tiles typically = 15/date
 - Temporal resolution: ~6 acquisition dates per quarter (14-day revisit)
 - AZ 2022: 7239 total tiles vs ~468 median - B8 CONFIRMED (exclude)
 - Full temporal coverage: all 15 states × 2 years × 4 quarters present on disk
 - FIPS-USDA overlap: 15 (BLOCKING gap - no labels for satellite FIPS)

Next: Step 6 - Phase 2 Satellite Encoder BLOCKED until FIPS-USDA gap resolved

7 Step 6 — Phase 2: Satellite Encoder (State-Level Training)

Trains a lightweight CNN encoder on Sentinel-2 AG tiles supervised by **state-aggregate USDA soybean yield**.

GAP 1 resolution (correct approach):

The Sentinel-2 tiles cover agricultural land across the **whole state** — the FIPS key in the HDF5 file (county ANSI 001) is the download identifier, not a spatial boundary.
The correct label is the **state-aggregate yield**: mean all USDA county records for that (state, year). Join key is (state_name, year) — a direct, semantically clean match.

Sub-step	Description
6.1	State-aggregate USDA labels — aggregate all counties per (state, year)
6.2	SentinelDataset + SentinelEncoder CNN (12-ch input, 64-dim embedding)

Sub-step	Description
6.3	Training loop, LOSO 2022 evaluation, save <code>sentinel_encoder.pt</code>

```
[34]: # -- Step 6.1 State-Aggregate USDA Labels
#
# Sentinel-2 imagery is organised by state directory (AL, AZ, AR ...).
# Each state dir uses county ANSI-001 as the HDF5 FIPS key, but the TILES
# COVER AGRICULTURAL LAND ACROSS THE WHOLE STATE - not just ANSI-001 county.
#
# Correct label = state-aggregate yield:
#   mean of ALL USDA county yields for that (state, year).
# Join key = (state_name, year) - direct match, no FIPS mismatch.

STEP 6 COMPLETE - Phase 2 Satellite Encoder

=====

Encoder backbone → e:\learnings\University Of Hull AI\assignment-september\MSc project\multimodal_agriculture_prediction-notebook_only\data\CropNet\labels\sentinel_encoder.pt

Full checkpoint → e:\learnings\University Of Hull AI\assignment-september\MSc project\multimodal_agriculture_prediction-notebook_only\data\CropNet\labels\sentinel_phase2_ckpt.pt

Train set : 14 state-years (2021 × 15 states, AZ2022 excluded)

Val set : 14 state-years (2022 hold-out, LOS0)

Val RMSE : 11.04 BU/ACRE

Embed dim : 64 - ready for Step 7 GMU fusion

Next: Step 7 - Phase 3 GMU Fusion (weather BiLSTM + satellite encoder)

8 Step 7 — Phase 3: GMU Fusion (Weather × Satellite)

Gated Multimodal Unit (GMU) fusing **128-dim weather embeddings** (BiLSTM, Step 4) with **64-dim satellite embeddings** (SentinelEncoder CNN backbone, Step 6). Fine-tuned on multi-modal state-years (2021–2022; AZ 2022 excluded per B8).

Architecture

WeatherInput (1, 9) → BiLSTM.encode() → e_w (128-dim)

SatelliteInput (12,224,224) → CNN.encode() → e_s (64-dim)

```
proj_w(e_w) → h_w (128-dim)
proj_s(e_s) → h_s (128-dim)
z = (W_z · [e_w; e_s]) ← modality gate
h = z * h_w + (1-z) * h_s ← gated fusion
head(h) → ŷ (scalar)
```

Training strategy - Phase A: Freeze both encoders — only gate + projections + head updated (60 epochs, LR = 5e-4) - Phase B: Unfreeze all — end-to-end fine-tuning (30 epochs, LR = 1e-5)

Sub-steps | Sub-step | Description | |—|—| | **7.1** | State-aggregate weather features; MultimodalDataset; deep-copy encoder warm-starts | | **7.2** | GMUFusionModel definition with gated fusion gate | | **7.3** | Phase A: frozen-encoder warm-start training | | **7.4** | Phase B: end-to-end fine-tuning + LOSO 2022 evaluation + cross-model comparison | | **7.5** | Bias audit: sliced RMSE/bias by state, year, quintile; modality gate diagnostics | | **7.6** | Save gmu_phase3_ckpt.pt + project summary |

```
[37]: # Step 7.1 State-aggregate weather, MultimodalDataset, encoder warm-start
#
# Three operations:
# 1. Aggregate county-level normalized HRRR features to state-year means.
# `weather_features[FEATURE_COLS]` is already z-scored from Step 2.4.
# 2. Build MultimodalDataset pairing per-state-year satellite images (Step 6.
    ↪2)
# with state-aggregate weather vectors. Join key: (state_name, year).
# 3. Deep-copy the trained BiLSTM LSTM module and trained SentinelEncoder,
    ↪backbone
# to use as warm-started encoder modules inside the GMU.

STEP 7.2 - GMUFusionModel

Layer breakdown:

weather_enc	(BiLSTM)	:	137,728 params	[warm-started]
sat_enc	(CNN backbone)	:	59,232 params	[warm-started]
proj_w	Linear(128→128)	:	16,512 params	[random init]
proj_s	Linear(64→128)	:	8,320 params	[random init]
gate	Linear(192→128)	:	24,704 params	[random init]
head	MLP(128+64+1)	:	8,321 params	[random init]
Total		:	254,817 params	
Encoder (frozen Phase A)		:	196,960 params	
Fusion (trained Phase A+B)		:	57,857 params	

Smoke test (one sample, random fusion init):

```

x_w  : (1, 1, 9) → e_w : (1, 128)
x_s  : (1, 12, 224, 224) → e_s : (1, 64)
ŷ    : 0.1068

```

Step 7.2 complete - GMUFusionModel instantiated.

Next: Step 7.3 - Phase A frozen-encoder warm-start training.

```

[39]: # Step 7.3 Phase A: Frozen-encoder warm-start
#
# Both BiLSTM LSTM and CNN backbone are frozen.
# Only the fusion components (proj_w, proj_s, gate, head) are trained.
# This allows the gate to learn the optimal modality weighting first,
# without risk of catastrophically forgetting the pre-trained representations.
#

===== CROSS-MODEL COMPARISON (LOSO 2022, state-aggregate) =====

Model	Val RMSE (BU/ACRE)	Granularity
Phase 1: BiLSTM (weather-only)	5.763	state-level
Phase 2: SentinelEncoder (satellite)	11.044	state-level
Phase 3: GMU (fused, Phase 3)	5.562	state-level

GMU improves over best single-modality by 0.201 BU/ACRE.

Step 7.4 complete - Phase B training and cross-model evaluation done.

```
[41]: # Step 7.5 Bias Audit - GMU Phase 3
#
# Fairness metrics mirroring the Step 4.5 protocol (applied on multimodal_
# records):
#
# (a) Sliced RMSE / Bias by state → check if any state is systematically_
# mispredicted
# (b) Sliced RMSE / Bias by year → 2021 vs 2022 separation
# (c) Yield-quintile bias check → B3 regression-to-mean test
# (d) CV-Error by state → flag poorly-served states (threshold 0.
# 20)
# (e) Modality-gate diagnostics → mean z-value per state reveals gate_
# behaviour:
# z 1 → weather-dominant z 0 → satellite-dominant z 0.5 →_
# balanced
```

=====
STEP 7 COMPLETE - Phase 3: GMU Fusion
=====
```

Architecture:

```
weather_enc  BiLSTM(hidden=64, layers=2, bidir=True) → 128-dim [warm-started
Phase 1]
sat_enc      CNN(12ch→32→64) + AdaptiveAvgPool          → 64-dim [warm-started
Phase 2]
proj_w       Linear(128 → 128)
proj_s       Linear( 64 → 128)
gate         Linear(192 → 128) + sigmoid ← modality importance per dimension
head         Dropout(0.3) → Linear(128→64) → ReLU → Linear(64→1)
Total params : 254,817
```

Three-phase performance summary (Jensen-corrected BU/ACRE, LOSO 2022):

Phase	Val RMSE	Granularity
Phase 1: BiLSTM - weather only	5.763	state-level
Phase 2: SentinelEncoder - satellite only	11.044	state-level
Phase 3: GMU - fused (weather + satellite)	5.562	state-level

Modality gate behaviour:

Global mean z = 0.5751 (balanced)

Bias audit status (Step 7.5):

```
B2 RMSE spread (state imbalance) : reported above
B3 regression-to-mean             : DETECTED
B5 HRRR single-snapshot proxy    : Acknowledged limitation
B8 AZ 2022 tile anomaly          : Excluded from training
Flagged CV-Error states          : none
```

Saved artefacts:

```
e:\learnings\University Of Hull AI\assignment-september\MSc
project\multimodal_agriculture_prediction-
notebook_only\data\CropNet\labels\gmu_phase3_ckpt.pt
```

Known limitations (to be discussed in dissertation):

Training set = state-years from 2021 only (~14 records).
 This is expected - Sentinel-2 CropNet only covers 2021-2022.
 Any reported R^2 and RMSE on this scale carry high uncertainty.
 Weather representation is a Jan-1 HRRR snapshot (B5), not growing-season.
 GMU trained at state-aggregate level - county-level GMU requires
 additional USDA data for county ANSI 001 (acknowledged data gap Step 3.1).
 Gate z interpretation is reliable only at $N \gg 20$.

Next: Step 8 - Robustness to Modality Dropout

9 Step 8 — Robustness to Modality Dropout

Goal: Measure how the trained GMU degrades when one or both input modalities are unavailable at inference time. This simulates real-world deployment failures: - Weather-feed interruption (HRRR API outage, B5 limitation) - Satellite unavailability (cloud cover, archive gaps, B8-class anomalies) - Complete data blackout (both modalities absent)

Protocol: Multiplicative scaling — $x_{\text{dropped}} = \alpha \cdot x_{\text{original}}$: - $\alpha_w = 0.0 \rightarrow$ weather input zeroed (satellite-only fallback) - $\alpha_s = 0.0 \rightarrow$ satellite input zeroed (weather-only fallback) - $\alpha_w = 0, \alpha_s = 0 \rightarrow$ catastrophic blackout (both absent)

Fairness dimension: Degradation reported per-state and per-yield-quintile. Low-yield counties (Q1) may suffer disproportionate harm under modality dropout.

Sub-steps: - **8.1** Define `evaluate_gmu_dropout()` helper; sanity-check vs Step 7.4 - **8.2** Discrete dropout matrix: Full / Wx-Drop / Sat-Drop / Both-Drop vs Phase 1 & 2 - **8.3** Partial dropout sweep: $\{0, 0.1, 0.25, 0.5, 0.75, 1.0\}$ degradation curves - **8.4** Fairness under dropout: sliced RMSE/bias by state and yield quintile - **8.5** Summary report and saved artefact

```
[43]: # Step 8.1 Modality Dropout Evaluation Framework
#
# Defines evaluate_gmu_dropout(): runs GMU inference with multiplicative
# input scaling:
#   x_w_dropped = alpha_w * x_w   (0.0 → weather branch receives zeros)
#   x_s_dropped = alpha_s * x_s   (0.0 → satellite branch receives zeros)
#
# All results Jensen-corrected to BU/ACRE for comparability.

```

STEP 8.5 - STEP 8 SUMMARY REPORT

CROSS-MODEL RMSE SUMMARY (BU/ACRE, Jensen-corrected, all multimodal records):

Model / Condition	RMSE	DRMSE vs GMU-Full
Phase 1 BiLSTM (weather-only)	5.052	-0.031
Phase 2 Sentinel (satellite-only)	11.412	+6.329
GMU - Full (both modalities)	5.083	-
GMU - Wx Drop (alpha_w = 0)	12.295	+7.212
GMU - Sat Drop (alpha_s = 0)	294067.814	+294062.732
GMU - Both Drop (alpha_w=alpha_s=0)	331572.875	+331567.792

KEY FINDINGS FOR DISSERTATION:

[F1] Modality criticality:

Weather dropout: DRMSE = +7.212 BU/ACRE

Satellite dropout: DRMSE = +294062.732 BU/ACRE

-> SATELLITE is the dominant modality.

Consistent with gate regime (BALANCED) observed in Step 7.5.

[F2] Gate adaptability under dropout:
 Full-modality gate: $z = 0.5751$ (BALANCED)
 Weather-dropped: $z = 0.5768$ (no significant shift)
 Satellite-dropped: $z = 0.6214$ (shifts to weather)
 Gate adaptive: YES

[F3] Catastrophic blackout (Both Drop):
 GMU - Both Drop RMSE = 331572.875 BU/ACRE (DRMSE = +331567.792)
 The GMU head bias terms produce a non-trivial output even with zero inputs.
 RECOMMENDATION: deployment must detect absent inputs and refuse prediction,
 not silently return a degraded output.

[F4] Phase 1 as fallback:
 Phase 1 BiLSTM (weather-only) RMSE = 5.052 BU/ACRE on multimodal records.
 GMU - Sat Drop RMSE = 294067.814
 Phase 1 RMSE = 5.052
 -> Gap = +294062.762 BU/ACRE

[F5] Fairness note (Step 8.4 heatmap):
 State-level RMSE degradation is non-uniform under dropout.
 Some states suffer disproportionately - particularly under weather dropout,
 consistent with the B1/B2 state-centroid proxy bias flagged in Step 3.3.

Next: Step 9 - Explainability (SHAP)

10 Step 9 — Explainability (SHAP)

Goal: Quantify feature contributions to Phase 1 BiLSTM predictions using SHAP KernelExplainer (model-agnostic black-box explainer).

Methodology: - SHAP KernelExplainer — treats the BiLSTM as a black box; DeepExplainer NOT used (gradient back-prop through LSTM gates is unreliable at seq_len=1) - Background: 50-centroid k-means summary of training features (N=2,744) - Explain set: first 200 test samples (N=686) - SHAP values on log-scale BiLSTM output; BU/ACRE dependence plots annotated

separately

Expected findings (agronomic priors): - Dominant features: `mstav` (soil moisture), `vpd_hpa` (vapour pressure deficit), `t2m_c` (air temperature) - `tp` (precipitation) expected near-zero — Jan-1 HRRR snapshot carries no accumulated precip (B5)

Geographic proxy flag (B1): If `sp_hpa` (surface pressure) ranks in top 3, it likely proxies state elevation/latitude rather than acting as a causal weather signal → flag triggered, feature removal recommended.

Sub-steps: - **9.1** SHAP setup: wrapper function, k-means background, smoke-test - **9.2** Kernel-Explainer computation on 200 test samples - **9.3** Feature importance bar chart (mean $|\text{SHAP}|$) + B1 geographic proxy check - **9.4** Beeswarm summary plot + dependence plots for top-2 features - **9.5** Summary report and saved artefact

```
[48]: # Step 9.1 SHAP Setup
#
# 1. Ensure SHAP is available (install if absent)
# 2. Extract 2D feature arrays from ds_train / ds_test (.X attribute, shape (N, 9))
# 3. Build BiLSTM wrapper: (N, 9) numpy → (N,) log-scale predictions
# 4. Compute 50-centroid k-means background summary from training set

=====

STEP 9.3 - FEATURE IMPORTANCE BAR CHART

=====

Feature importance ranking (mean |SHAP|, log BU/ACRE):

Rank	Feature	Mean SHAP	Bar
1	d2m_c	0.111325	
2	sp_hpa	0.049081	← B1 geographic proxy SUSPECT
3	r2	0.048116	
4	tcc	0.043754	
5	mstav	0.036034	
6	t2m_c	0.034139	
7	vpd_hpa	0.020687	
8	wind_speed	0.014162	
9	tp	0.000000	

Top-3 features: ['d2m_c', 'sp_hpa', 'r2']

[B1 FLAG TRIGGERED] sp_hpa ranks #2 (top-3).

Surface pressure is primarily an elevation/latitude signal.

In the Corn Belt, sp_hpa correlates strongly with state geography.

RECOMMENDATION: Remove sp_hpa from FEATURE_COLS and retrain Phase 1.

(See PROJECT_PLAN.md - Step 9 B1 geographic proxy check)

Agronomic prior top-3 : ['mstav', 't2m_c', 'vpd_hpa']

SHAP actual top-3 : ['d2m_c', 'sp_hpa', 'r2']

Overlap : 0/3

Low overlap with priors - likely due to Jan-1 snapshot limitation (B5).

Figure saved: e:\learnings\University Of Hull AI\assignment-september\MSc project\multimodal_agriculture_prediction-notebook_only\data\CropNet\labels\step9_feature_importance.png

=====
STEP 9.5 - STEP 9 SUMMARY REPORT
=====

```

COMPLETE FEATURE IMPORTANCE RANKING (Phase 1 BiLSTM, SHAP KernelExplainer):

Rank	Feature	Mean SHAP
1	d2m_c	0.111325
2	sp_hpa	0.049081
3	r2	0.048116
4	tcc	0.043754
5	mstav	0.036034
6	t2m_c	0.034139
7	vpd_hpa	0.020687
8	wind_speed	0.014162
9	tp	0.000000

KEY FINDINGS FOR DISSERTATION:

- [F1] Top-ranked feature : d2m_c
d2m_c was not in the expected top-3 (mstav, vpd_hpa, t2m_c).
Likely artefact of Jan-1 single-snapshot limitation (B5 in Step 3.1).
Growing-season HRRR data would be needed to confirm agronomic priors.
- [F2] Agronomic prior vs SHAP top-3 overlap:
Expected top-3 : ['mstav', 't2m_c', 'vpd_hpa']
SHAP actual top-3 : ['d2m_c', 'sp_hpa', 'r2']
Overlap : 0/3
-> LOW overlap. Single-snapshot HRRR (B5) is the most likely explanation.
The model picks up on whatever variance the Jan-1 snapshot provides.
- [F3] Geographic proxy check (B1) - sp_hpa rank: #2
[B1 FLAG TRIGGERED] sp_hpa in top-3.
Surface pressure is primarily determined by elevation and latitude.
In the Corn Belt study region, it serves as a de facto state identifier.
RECOMMENDATION: Remove sp_hpa from FEATURE_COLS and retrain Phase 1.
Expected impact: minor RMSE change (sp_hpa carries limited unique signal);
improved model fairness (no implicit geographic discrimination).
- [F4] tp (total precipitation) rank: #9
Mean |SHAP| = 0.000000 (vs global mean 0.039700)
tp contribution is negligible - consistent with B5 data limitation.
tp = 0 for all records in the Jan-1 initialisation file.
SHAP correctly identifies tp as a non-informative feature.
- [F5] SHAP methodology caveat (dissertation transparency):
KernelExplainer uses a Shapley-kernel weighted linear regression.
It is the correct choice for BiLSTM at seq_len=1 (no temporal dynamics).
With growing-season HRRR sequences, DeepLIFT or GradientExplainer
would be preferable for exploiting the LSTM's temporal structure.
All attributions are approximate - SHAP values explain variance, not
causation.

STEP 9 COMPLETE - Explainability (SHAP)

=====

Next: Step 10 - Final Evaluation & Dissertation Reporting

10.1 Step 10 — Final Evaluation, Bias Audit & Dissertation Reporting

Goal: Consolidate all model results into publication-quality figures and tables.

Sub-step	Content
10.1	Predicted vs Actual scatter plots (Phases 1 – 3)
10.2	Residual histograms + normality summary
10.3	Full fairness table: RMSE / MAE / R ² / Bias sliced by state, year, quintile
10.4	Jensen inequality correction documentation
10.5	LOYO 2022 cross-model summary
10.6	Geographic coverage gap analysis
10.7	SHAP feature importance consolidated summary
10.8	Modality dropout degradation chart
10.9	Aggregate final comparison table + artefact save

All figures saved at **300 DPI** to data/CropNet/step10_figures/.

[53]: # Step 10.1 & 10.2 - Final Scatter, Residual Histograms, Phase 2/3 Scatter
All Phase 1 models on the 686-record test set, Phase 2/3 on multimodal set.
Exported at 300 DPI for dissertation submission.

=====

STEP 10.4 - JENSEN INEQUALITY CORRECTION (Documentation)

=====

Applied formula (USE_LOG=True):

$$y_{BU/ACRE} = \exp(y_{log} + \sigma^2_{residual} / 2)$$

JENSEN_SIGMA2 = 0.029034 (residual variance on training split)

$\exp(\sigma^2/2)$ = 1.014623 (multiplicative correction factor)

BiLSTM test-set mean (uncorrected $\exp(y)$) : 49.852 BU/ACRE

BiLSTM test-set mean (Jensen-corrected) : 50.581 BU/ACRE

True test-set mean : 51.225 BU/ACRE

=====

STEP 10.5 - LOYO 2022 CROSS-MODEL EVALUATION SUMMARY

=====

Phase 1 results on 2022 test subset (n=120):

BiLSTM RMSE = 8.622 BU/ACRE

Ridge RMSE = 11.633 BU/ACRE

Gradient Boost RMSE = 6.959 BU/ACRE

Phase 2 SentinelEncoder (LOSO 2022 val) : 11.044 BU/ACRE
Phase 3 GMU (LOSO 2022 val) : 5.562 BU/ACRE

GMU vs best single-modality: -1.824 BU/ACRE
-> GMU improves over best single-modality model.

=====

STEP 10.6 - GEOGRAPHIC COVERAGE GAP

=====

FIPS in Phase 1 model : 649 counties
Approx total US soybean : ~1400 counties
Coverage gap : 53.6%

Any deployment must disclose excluded counties.
Predictions for under-represented states carry
materially higher uncertainty than the headline RMSE.

=====

STEP 10.7 - SHAP FEATURE IMPORTANCE (Phase 1 BiLSTM, Step 9)

=====

Rank	Feature	Mean SHAP	Notes

1	d2m_c	0.111325	
2	sp_hpa	0.049081	[B1 geographic proxy]
3	r2	0.048116	
4	tcc	0.043754	
5	mstav	0.036034	
6	t2m_c	0.034139	
7	vpd_hpa	0.020687	
8	wind_speed	0.014162	
9	tp	0.000000	-> near-zero (Jan-1 init, B5)

B1 sp_hpa rank : #2 (FLAGGED)
Top-3 overlap with agronomic priors: 0/3

=====

STEP 10.8 - MODALITY DROPOUT DEGRADATION (Step 8 Summary)

=====

Global gate z (full modality): 0.5751 (BALANCED)

Condition	RMSE	Delta vs full

GMU Full (a_w=1, a_s=1)	5.083	baseline
GMU Wx-Drop (a_w=0)	12.295	+7.212

GMU Sat-Drop (a_s=0)	294067.814	+294062.732
GMU Both-Drop (a_w=0, a_s=0)	331572.875	+331567.792

fig10_6 (300 DPI) -> fig10_6_dropout_degradation.png

=====

STEP 10.9 - FINAL MODEL COMPARISON (All Phases)

=====

		RMSE	MAE	R2	N_test
Granularity	RTM				
Phase	Model				
Baseline	Ridge Regression	9.302	7.267	0.2377	686
county	Yes				
	Gradient Boosting	6.923	5.385	0.5778	686
county	Yes				
Phase 1	BiLSTM (weather-only)	7.386	5.791	0.5194	686
county	Yes				
Phase 2	SentinelEncoder (satellite)	11.044	9.380	-0.0761	28
state	n/a				
Phase 3	GMU (fused: weather + satellite)	5.562	4.562	0.7403	28
state	n/a				

Summary table saved: step10_final_model_summary.csv

Artefact bundle: step10_final_report.pt

=====

STEP 10 COMPLETE

Figures (300 DPI): E:\learnings\University Of Hull AI\assignment-september\MSc project\multimodal_agriculture_prediction-notebook_only\data\CropNet\step10_figures

10.2 Step 10 — Ethics, Limitations & Responsible Deployment

10.2.1 10.A — Geographic Equity Gap

The Phase 1 model was trained on **~634 of ~1,400 US soybean-producing counties** (45%), concentrated in the Corn Belt (IL, IA, IN, MN, NE). The remaining **55% of US soybean counties are unrepresented** and cannot receive predictions.

Disclosure requirement: Any deployment must list excluded counties and state explicitly that predictions for under-represented states carry materially higher uncertainty than the headline RMSE.

10.2.2 10.B — USDA Surveyor Bias (B9)

USDA NASS surveys **over-represent large commercial farming operations**. Subsistence farmers, organic-only operations, and farms below the minimum acreage reporting threshold are absent from the training data.

Constraint: The model **must not** be used to advise smallholder farms, OFR-exempt operations, or entities not represented in NASS surveys. This bias cannot be corrected without external ground-truth data.

10.2.3 10.C — Food Security Embargo

Predictions must **not be released publicly before the corresponding official USDA NASS crop report**. Early publication can distort commodity futures markets.

Protocol: (1) Embargo predictions until USDA NASS release date. (2) Accompany all published figures with probabilistic confidence intervals. (3) No field-level disaggregation — county-aggregate only.

10.2.4 10.D — Climate Non-stationarity

Trained on **2016–2022 only**. The model **must not** be assumed valid beyond 2025 without recalibration. The 2019 observation is confounded by US-China trade war + Midwest flooding.

10.2.5 10.E — Identified Bias Summary

ID	Bias	Severity	Status
B1	State-centroid weather proxy	High	SHAP sp_hpa rank check (Step 9)
B2	Corn Belt geographic dominance	High	Detected — state CV-error audit
B3	Regression-to-mean (quintile)	Medium	Checked per model (Step 10.3)
B4	Log-target Jensen bias	Medium	Corrected: $\exp(y + \sigma^2/2)$
B5	HRRR single-snapshot (Jan-1)	High	Acknowledged — growing-season files needed
B6	USDA reporting threshold omission	Medium	Counties <3 years flagged
B7	Random 80/20 temporal mixing	Low-Med	LOYO 2022 supplement (Step 10.5)
B8	Sentinel-2 AZ 2022 tile anomaly	Medium	AZ 2022 excluded from Phases 2 & 3
B9	USDA surveyor bias	Medium	Documented; no correction possible

10.2.6 10.F — Key Dissertation Tradeoffs

Tradeoff	Description
Accuracy vs Fairness	State-level CV-error weighting improves under-represented states but raises Corn Belt RMSE. Report both weighted and unweighted metrics.
Complexity vs Interpretability	Ridge Regression recommended for policy contexts; GMU for research. SHAP for BiLSTM is approximate (KernelExplainer on tabular inputs).
Log Transform vs Interpretability	USE_LOG=True benefits optimisation but requires Jensen correction. Always back-transform and report in BU/ACRE.
Modality Richness vs Deployability	GMU requires both modalities; Sentinel-USDA FIPS gap limits Phase 2/3. Phase 1 is the only currently deployable system — a data infrastructure finding, not a model deficiency.

All Step 10 figures exported at 300 DPI to `data/CropNet/step10_figures/`.
